Pax:81-45-503-9566)
An Ababidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al. (1998) Plant J. 15:707-720; Seki et al. (2002) Science 296:141-145). cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1-E vector (Carninci et al. (2001) Genomics 77:79-90) digested with BamHI and SalI. This clone is in a modified Bluescript vector.

Large-scale analysis of RIKEN Arabidopsis full-length (RAFL) CDNAs Unpublished 2 (Dases 1 to 1709) 2 (Dases 1 to 1709) 3 Totoki,Y., Seki,M., Ishida,J., Nakajima,M., Enju,A., Kamiya,A., Narusaka,M., Shin-i,T., Nakagawa,M., Sakamcto,N., Oishi,K., Kohayashi,M., Toyoda,A., Sakaki,Y., Sakurai,T., Iida,K., Akiyama,K., Satou,M., Toyoda,T., Konagaya,A., Carninci,P., Kawai,J., Hayashizaki,Y. and Shinozaki,K. Direct Submission Submitted (06-SEP-2004) Motoaki Seki, RIKEN Genomic Sciences Center; 1-7-2 Suehiro-cho, Tsurumi-ku, Yokohama, Kanagawa 230-0045, Japan (E-mail:meski@gsc.riken.jp.	URL:http://rarge.gsc.riken.jp/, Tel:81-45-503-9625, Fax:81-45-503-9686) An Arabidopsis full-length cDNA library was constructed essentially as reported previously (Seki et al. (1998) Plant J. 15:707-720; Seki et al. (2002) Science 296:1141-145). cDNA cleaved with BamHil and XhoI was ligated to modified Lambda FLC-1-E vector (Carninci et al. (2001) Genomics 77:79-90) digested with BamHI and SalI. This clone is in a modified pBluescript vector. Please visit our web site (http://rarge.gsc.riken.jp/) for further details.	<u>Φ</u>	/ Godon start=1 /product="hypothetical protein" /product="hypothetical protein" /product="hypothetical protein" /product="hypothetical protein" /db_xxef="d1:5197062" /tranalation="makPSTSMWATLQKKRWPLMILLVLSVSTVGMILVRSTFDSCSV /tranalation="makPSTSMWATLQKKRWPLMILLVLSVSTVGMILVRSTFDSCSV /cranalation="makPSTSMWATLQKKRWPLMILLVLSVSTVGMILVRSTFDSCSV /tranalation="makPSTSMWATLQKKRWPLMILLVGSELSGCPLILMELAFLL RCVESEVVWITNORPVEDEVIKVLERVLENBERGHYFRPDIJVKHLPPVAGAMIDSHATAEY AVAGKMILDAJLKONVPRYTVVHLGNSKELMEVAEDSFAKOVLREQVRESLGVRNEDILFG IINNSVRGKGQDILFLRAFHESLKVIKETKKLEVPTMHAVVVGSNAAQTRETELANF VQEMKLQKIVHPVRTMKVAPYLAAIDVLVQNSQARGECFGRITIEAMAFKLPVLGTA AGGTMETVVNRTMYGROCYLPLARAIOTAMINTAMINTKGRSFKLPVLGTA HMMSHRIASVLREVLQHAKIHSRTTNSDH"	Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SGS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         e-mail for correspondence: arab@sequence.stanford.edu
Genes with similarity to proteins in the databases are named
'putative', "like' or 'similar to'. Genes that have EST
similarity but no significant protein similarity are described as
'unknown proteins'. Genes that are annotated based only on gene
prediction software are described as 'hypothetical proteins'. The
gene prediction programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://compbio.ornl.gov/section/index.html), GENSCAN (Chris Burge,
http://gnomic.stanford.edu/-chris/GENSCAN html), and NetPlantGene
(S.M. Hebsgaard, et al., Cabris/GENSCAN html), and NetPlantGene

Bases 1-32,040 of IGF clone F1B16 overlap with bases 97,508-129,547 of IGF clone F10A5, gpl_AC006434.

e-mail for correspondence arab@sequence.stanford.edu Genes with similarity to proteins in the databases are named 'putative', '-like' or 'similar to'. Genes that have EST similarity but no significant protein similarity are described as 'unknown proteins'. Genes that are annotated based only on gene prediction software are described as 'hypothetical proteins'. The gene prediction programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/section/index.html), GENSCAN (Chris Burge, http://genes.mit.edu/GENSCAN), FEXA (Victor Solovyev, Http://genemic.sanger.ac.uk/gf/gf.shtml), and NetPlantGene (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/NetPlantGene.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          join(43756. .44347,44507. .44562,44700. .44966,45493. .45755,

                           The orientation of the sequence is from SP6 to T7 of the PAC clone. This sequence of P0469E09 clone has an overlap with P0699D11 (DDBJ: AP002817) clone at 5' end and with P0453A06 (DDBJ: AP001383) clone at 3' end. Detailed information on overlap and assembly quality together with annotation of this entry is available at ttogether with annotation of this entry is available at ttogether define at together (Coation) (Qualifiers)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note="contains EST(s): AU030894(E60405), AU030895(E60405)

Genes were predicted from the integrated results of the following:
(E-mail:tsasaki@nias.affrc.go.jp/Robark.hmm], FGENESH
(http://opal.biology_gatech.edu/GeneMark/), GlimmerM
(http://www.tigr.org/tdb/glimmerm/glmr.form.html), RiceHMM
(http://www.tigr.org/tdb/glimmerm/glmr.form.html), splicePredictor
(http://piolinformatics.iastate.edu/GeneMark/), SplicePredictor
(http://plobin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://globin.cse.psu.edu/html/docs/sim4.html), gap2
(http://nobi.nlm.nih.gov/blast/db) and the cDNA
sequence was searched against NCBI NonRedundant Protein database
with BLASTP. ESTS represent the identified cDNA sequences using
BLASTN with the corresponding DDBJ accession no.
A gene with identity or significant homologies of the coding
classified based on the protein name to indicate the homology level
such as same name, 'putative' and 'like protein', A gene without
significant homology to any protein be und 'like protein', a gene without
significant homology to any protein with fell beartial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sasaki, T., Matsumoto, T., Yamamoto, K., Sakata, K., Baba, T.,

* NOTE: This is a "working draft' sequence. It currently
* Consists of 21 contigs. The true order of the pieces
* anot known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved.

cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
```

Claim 1; SEQ ID NO 3707; 15pp; English.

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in meletronic form from the US patent office at available in electronic form from the US patent office at the sequence uspto. 2004014888. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, ingnin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or upcake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert of the invention

The invention relates to a recombinant polymucleotide comprising any of the 58798 Cotton plant cDNA sequences mentioned in the specification.

CC the 58798 Cotton plant cDNA sequences mentioned in the specification.

CC ansor a recombinant polypeptide comprising any producing a plant having an improved property.

CC comprises transforming a plant with a recombinant construct comprising a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a polypeptide associated by with the property, and growing the transformed plant. The polypeptide is useful for improving plant coll tolerance, manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant country in plant of the cell cycle pathway, improving plant tolerance, producing galactomannan (or Inginio or plant growth regulators), improving plant the atte of homologous recombination in plants, improving plant tolerance to extreme osmocic conditions or to pathogens or pested; improving plant conditions or pathogens or pested; improving plant companied by modification of photosynthesis, modifying seed oil or protein yield and/or content, improving yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptashe, or improving yield by providing improved plant growth and development under at least one stress condition. The polymucleotide and polypeptide may also be used in recombinant DNA content can in commuter hased storage and analysis and systems the present companies. of the printed specification, but was obtained the invention. NOTE: The sequence data polynucleotide sequences were available, the remaining 52213 polynucleotides and all 58798 protein sequences were not present or in computer-based storage and analysis systems. The present is a Cotton plant cDNA of the invention. NOTE: The sequence day seqdata.uspto.gov/sequence.html?DocID=20040181830. The invention relates to a corn seedling-derived polymucleotide (cdp)
selected from ADS64985-ADS71316, or their complements and fragments. Also
included are a composition for the detection of altered expression of a
cdp (comprising a polymucleotide selected from ADS64985-ADS71316), a
cdp (comprising a polymucleotide in a biological sample using a cdp,
cdp an expression polymucleotide in a biological sample using a cdp, a
ceedling specific regulatory element that regulates the expression of a
seedling specific regulatory element that regulates the expression of a
cdp, an expression vector containing a cdp or regulatory element, a plant
transformed with the vector, a host cell containing the vector (and
expressing a compound which binds a CDP and screening a plurality of
compounds for binding to cdp polymucleotide. The cdp polymucleotides,
compounds for binding to cdp polymucleotide. The cdp polymucleotides,
compounds for binding to and antibodies are useful for the
dentification, evaluation and alteration, fungal disease, bacterial
cdisease resistance (e.g. to insect infestation, fungal disease, bacterial
infection, Goss' Bacterial Wilt, blight, Stewart's bacterial Wilt, Holcus
spot, bacterial leaf blight, leaf spot, bacterial stripe and maize dwarf
mosaic virus infection) and resistance to environmental stress (e.g.
water stress, pH stress, temperature stress, pollution, injury or
pesticides. The present sequence is cdp cDNA sequence. Corn; seedling-derived polynucleotide; cdp; ss; plant; seed growth; seed development; disease resistance; insect infestation; fungal disease; bacterial infection; Goss' Bacterial Wilt; blight; Stewart's bacterial Wilt; Holcus store; bacterial leaf blight; leaf spot; bacterial stripe; maize dwarf mosaic virus infection; environmental stress; water stress; pH stress; temperature stress; New corn seedling-derived polynucleotides and polypeptides, useful in identifying and altering desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality Corn seedling-derived polynucleotide (cpds), SEQ ID 6035.            identifying a compound which binds a CDP and screening a plurality of compounds for binding to cdp polynucleotide. The cdp polynucleotides, proteins, vectors, cells and antibodies are useful for the identification, evaluation and alteration of seed growth and development, disease resistance (e.g. to insect infestation, fungal disease, bacterial infection, Goss' Bacterial Wilt, blight, Stewart's bacterial Wilt, Holcus mosaic virus infection) and resistance to environmental stress (e.g. water stress, pH stress, temperature stress, pollution, injury or pesticides. The present sequence is cdp cDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

```

The invention relates to a recombinant polymucleotide comprising any of the 58798 Cotton plant CDNA sequences mentioned in the specification.

Also a recombinant polypeptide comprising any of the 58798 amino acid sequences mentioned in the specification and producing a plant with a recombinant construct comprising an improved property. Producing a plant with a recombinant construct comprising a plant with a recombinant construct comprising a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a promoterty, and growing the transformed plant. The polymetide is useful for improving plant cold tolerance for a polypeptide associated with the property, and growing the transformed plant. The polypeptide is useful for improving plant cold tolerance, manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant drought tolerance, providing increased resistance to plant disease, to producing galactomannan (or lignin or plant growth regulators), improving plant heat tolerance, improving plant tolerance to herbicides, increasing the rate of homologous recombination in plants, improving plant tolerance to extreme osmotic conditions or to pathogens or pests, improving yield by modification of photosynthesis, wodifying seed oil or proteath yield and/or content, improving yield by modification of carbohydrate, introgen cor phospinus use and/or uptake, or improving yield by providing improved plant growth and development under at least one stress condition. The polymucleotide and polypeptide may also be used in recombinant DNA content sequence constructs, in physical arrays of molecules, as plant breeding markers, constructs, in physical arrays of molecules.

Constructs, in physical arrays of molecules, as plant breeding markers, constructs, in the present sequence the present sequence is a cotton plant form plant from the printed specification, but was obtained in a larrancy of man consult. 368 512 GTCACATATAGCTTGGAGCATAGGATGTTGAACCATGGAGTGCAGGTTTTACCAGCTAGA 488 608 692 752 Gossypium 249 ACCGCCGTCGCCAGCGGAGTCCCCTCGGGTTCATGAGGTCCAAGCTCGTGCTCCTCGTC 393 ATCGCGCTGTGAAGCCGAGTCCGCTTAAGCTTTATGAAGTCCACGCGTCCGCTGCTGGTT TCCCATGAGCTCTCCCTCTCTGGTGGTCCACTTTTACTGATGGAATTAGCATTTCTTCTG 453 receiecide de la receienta GTAACATATAGTTTTAGAACATAAGATGTTGGACAGAGGAGTACAGGTTATCTCAGCTAAG GCTGGCAAGTGGCTTGACCCTGTTCTGAAAGATCATGTTCCTAAAGTCCTTCCGAAGATT GCTGGGAAATGGCTGGATGTTGTTCTTAAGGAGATGTTCATCGTGTTCTGCCTAAGGTG AGGCATGTTGGCTCGCAAGTGGTGTGGATAACAAACCAGAGATCACAAGAAACAAATGAT GGACAGGAGGCAGTTGATATTGCTCTAAAAGCTGATCTGGTTATCTTAAACACTGCTGTT TIGTGGTGGATCCATGAAATGCGTGGGCATTACTTTAAGGTTGAATATGTCAAACATCTT only 6585 .Gaps polynucleotide sequences were available, the remaining 52213 polynucleotides and all 58798 protein sequences were not present. ä, New recombinant nucleic acid molecules and polypeptides from Go hirsutum, useful for producing plants with improved biological characteristics (e.g. improved plant cold or drought tolerance) Query Match 14.4%; Score 244.8; DB 13; Length 948; Best Local Similarity 68.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to Arabidopsis thaliana nucleic acid sequences. The DNA sequences and the polypeptides they encode are useful for identifying homologous or related genes, for producing compositions that modulate the expression or function of the polypeptides, for mapping functional regions of the protein, in diagnosis, for studying associated physological pathways, for genetic manipulation of cells, preferably plant cells, in screening assays of various plant strains to determine the strains that are capable of withstanding a particular disease or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1442
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
environmental stress, for enhancing or inhibiting production of biosynthetic products in plants and to create genetically modified and transgenic organisms, such as plant to cast genetically modified and are useful for introducing or improving disease resistance and stress tolerance in plants, screening biologically active agents, such as fungicides and insecticides, and for elucidating biochemical pathways. Sequences ABX56649-ABX57647 represent Arabidopsis thaliana plantways of the invention. Note: The sequence date for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         209
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      149
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             448 AACTTTGTCCACTTCGTCAACAAACTCTAACCGTAGCACCATATATAGCAGCCATAGAC 389

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to 17880 cotton expressed sequence tags (ESTs; ACN45220-ACN63099). The ESTs were isolated from CDNA libraries generated from primed or non-primed seeds from variety DPSOB, mature seeds from variety COker 312 Bowsell 96 Field, and androcetum tissue, gynoccium tissue, developing fibres, carpel walls and septa from variety Nucotton33B. The invention also relates to substantially purified proteins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes, to map genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cotton; plant; BST; expressed sequence tag; transgenic plant; gynoecium; varitety Nucotton13B; library LIB3829; molecular tag; molecular marker; genetic mapping; molecular mapping; seed germination; plant growth; plant quality; plant yield; plant breeding; tissue printing; ss.

CC the 58798 Cotton plant cDNA sequences mentioned in the specification.

CC sequences mentioned in the specification and producing a plant having an improved property comprises transforming a plant with a recombinant construct comprising a comprise transformed property of plant with a recombinant construct comprising a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a promoterty, and growing the transformed plant. The polypeptide is constituted in moroving plant cold tolerance for a polypeptide associated constitution of the cell cycle pathway, improving plant cold tolerance, manipulating growth rate in plant tolerance, providing increased resistance to plant disease, corought tolerance, improving plant tolerance to plant disease, improving plant have tolerance in moroving plant tolerance to herbicides, increasing conditions or plant growth regulators), improving plant tolerance conditions or to pathogens or pests, improving yield by modification of photosynthesis, modifying seed oil or protein yield by modification of and/or uptake, or improving yield by providing improved plant growth and development under at least one stress condition. The constructs, in physical arrays of molecules, as plant breeding markers, or in computer-based storage and analysis systems. The sequence data for this condition to form part of the printed specification, but was obtained in electronic format directly from USPPO at condition, but was obtained in electronic format directly from Sequence and systems. The sequence and condition are asset and sequence are asset and sequence and sequence are asset in computer sove sequence the printed sequence and an electronic format directly from USPPO at the present sequence and sequence are asset as a sequence and sequence and sequence are asset as a sequence and sequence ar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

links in metabolic and catabolic pathways. The mucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically detecting the expression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a cotton variety Nucotton338 gynoecium tissue cDNA library (LIBB229). The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence format for the printed sequence format directly from the US
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Claim 1; SEQ ID NO 6176; 14pp; English.

The invention relates to a recombinant polymucleotide comprising any of the 58798 Cotton plant CDNA sequences mentioned in the specification.

The Also a recombinant polypeptide comprising any of the 58798 amino acid sequences mentioned in the specification and producing a plant having an improved property.

Comprises transforming a plant with a recombinant construct comprising a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a promoter region functional in a plant cell operably joined to a promoter, and growing the transformed plant. The polypeptide is useful for improving plant cold tolerance, manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant cold tolerance, manipulating growth rate in congulators, improving plant tolerance to plant disease, increasing producing galactomannan (or lignin or plant sylend to perance, improving plant tolerance to herbicides, increasing producing plant colling plant tolerance to herbicides, increasing the rate of homologous recombination in plants, improving plant tolerance to extreme osmotic conditions or to pathogens or peets, improving plant tolerance to herbicides, increasing to extreme osmotic conditions or to pathogens or peets, improving yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, or improving yield by providing improved plant growth and development under at least one stress condition. The collant growth and development under at least one stress condition. The collant content, improving yield by modification of carbohydrate, nitrogen or in computer-based storage and analysis systems. The present sequence is a Cotton plant cDNA of the printed specification, but was obtained to patent did not format directly from USPFO at the printed specification, but was obtained to patent with the process of the printed specification of long to the present of the printed specification of long to the present of the printed speci ö 989 746 Argarrigarricacacgrcacacagaararriggaagaaraggacrcaagaggegrigaag 132 806 13 Ardcdaddccarrrcrararradagrardraaacarccaccarcraraccraca 72 ATGATTGATTCTCATACAACGGCTGAGTATTGGAATAGCAGGACTAGCGATCGCCTGAAA ATACAGATGCCACAAACTTATGTTGTTCACCTGGGGAATAGTAAAGAACTAATGGAAGTT 627 ATGCGTGGGCATTACTTTAAGGTTGAATATGTCAAACATCTTCCCTTTGTTGCTGGAGCC segdata uspto gov/seguence.html?DocID=20040181830. However only 6585 polynucleotide seguences were available, the remaining 52213 polynucleotides and all 58798 protein seguences were not present. Gaps ö Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to 17880 cotton expressed sequence tags (ESTS;
ACM4520-ACM63099). The ESTS were isolated from cDNA libraries generated
Crom primed or non-primed seeds from variety DP50B, mature seeds from
variety Coker 312 Boswell 96 Field, and androceium tissue, groceium
Crom primed or non-primed seeds from variety wariety
Cromptismed planes, carpel walls and septa from variety
Nucotton33B. The invention also relates to substantially purified
proteins or their fragments encoded by nucleic acid construct
comprising a nucleic acid of the invention. The cotton ESTS are useful as
molecular tags to isolate genetic regions, to isolate genes, to map
genes, to determine gene function and to determining whether genes are
members of a particular gene family. The nucleic acid molecules may be
used for isolating a variety of agronomically significant genes
used for isolating a variety of agronomically significant genes

links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to matigate stresses encountered during seed germination. The BSTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express agronomically significant genes in these tissues and/or other tissues, and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or mRNA and for detecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a cotton variety Nucottoni3B gynoecium tissue cDNA library (LIB3829). The sequence data for this patent did not form part of free printed from the use opecification, but was obtained in electronic formed directly from the US
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1221

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              259
                                                                                                                                                                             Sequences AAA31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences AAA32094-A32096 with left and right flanking sequences. The polynuclectide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in positional cloning of genes, in variety identification and in evaluations, cultivars, species and species between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          79

The invention relates a recombinant DNA construct comprising a polymeptide with any of 5544 amino acid sequences (CDNAs SEO INO: 1-5544) and encoding a polymeptide with any of 5544 amino acid sequences (SEO IN No: 5454-1108). The CDNAs and proteins are from corn, soybean, which and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of proteins at a method of sequences is derived from which organism. Also included is a method of proteins a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising transforming a plant with a recombinant DNA construct comprising transforming a plant with a plant cell operably joined to a polymucleotide encoding polant with a plant tell polant cells by modification of the cell cycle pathway, for improving plant coll tolerance to plant disease, for galactomannan production, for providing increased resistance to plant disease, for improving plant tolerance to plant disease, for improving plant tolerance to extreme osmetic conditions, for improving plant tolerance to extreme pasts, for yield improvement by modification of plant tolerance to extreme pasts, for yield improvement by modification of combination in plants, for light in proving plant tolerance to extreme pasts, for yield improvement by modification of carabohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by modification of carabohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and derycopence of phosphorus and and/or content, for yield improvement by modification and for yield improvement by expending improved plant growth and for yield improvement by providing improved plant growth and for yield improvement by providing improved plant growth and for yield improvement by providing improved plant general caracteristics such as increased yield, improved introgen for producing arransferiors of the invention. Note: The s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1365
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1425

New maize or soybean enzymes and nucleic acid molecules associated with the sucrose pathway, useful for genome mapping, gene identification and analysis, plant breeding, or preparation of constructs for plant gene

Claim 2; Page; 117pp; English.

The invention relates to a substantially purified nucleic acid molecule (appearing as ADA57847 - ADA60660 that encodes a maize or soybean enzyme or its fragment, associated with the sucrose pathway selected from:

Cor its fragment, associated with the sucrose pathway selected from:

triose phosphate isomerase, fructose 1,6-bisphosphate aldolase, fructose fructose prosphotransferase, invertase, sucrose synthase, taructose-6-phosphate phosphotransferase, invertase, sucrose synthase, caphosphate (DDP) educose pyrophosphate kinase (MDP) kinase, chosphate (UDP) educose pyrophosphotylase. Also included are a substantially purified maize or soybean enzyme (or its fragment) and a transformed plant having a nucleic acid molecule. Also included are a substantially purified antibodies capable of specifically binding to the maize or soybean enzyme, determining a level or pattern of a plant sucrose pathway excepted antibodies capable of specifically binding to the maize or soybean enzyme, determining a level or pattern of a plant sucrose pathway enzyme, determining a mutation in a plant core pathway enzyme, producing a plant containing an overexpressed or reduced level of plant sucrose pathway enzyme in a plant trait. The maize or overexpressed or reduced level of plant sucrose pathway enzyme in a plant trait. The maize or soybean enzymes and nucleic acid molecules are useful for genome mapping, gene identification and analysis, plant breeding, or preparation of constructs for plant gene expression and transgenic plants. The nucleic acid molecules are useful as markers or probes. The present sequence is a soybean BST (expressed sequence tag) from a gene encoding a sucrose cathway enzyme. Note: The sequence data for this patent did not form part

ranscription factor or its fragment defined above; a substantially purified antibody or its fragment which is capable of specifically binding to the transcription factor or its fragment which is capable of specifically binding to the transcription factor or its fragment above; a transformed plant; a method for determining a level or pattern in a plant cell of a transcription factor in a plant; a method of producing a plant containing an overexpressed protein ore reduced levels of plant containing an overexpressed protein ore reduced levels of plant containing an overexpressed protein ore reduced levels of plant containing an association between a plant trait; and a method of isotating a nucleic acid that encodes a plant transcription factor or its fragment. The nucleic acid molecules, proteins and their fragments are useful for genome mapping, gene identification and analysis, plant breeding, preparation of constructs for use in plant gene expression and transgenic plants. The nucleic acid molecules are useful as markers or probes. This sequence represents a soybean transcription factor polynucleotide.

Sequence 54, Application US/10152886

Sequence 54, Application US/10152886

Patent No. 6912470

GENERAL INFORMATION:

APPLICANT: ECOPIA BIOSCIENCES INC.

APPLICANT: Staffa, Alfredo

APPLICANT: Staffa, Alfredo

APPLICANT: Zazopoulos, Emmanuel

TITLE OF INVENTION: GENES AND PROTEINS INVOLVED IN THE BIOSYNTHESIS OF ENEDIYNE RING

TITLE OF INVENTION: STRUCTURES

FILE REFERENCE: 3011-30S

CURRENT APPLICATION NUMBER: US/10/152,886

CURRENT APPLICATION NUMBER: US/10/152,886

SOFTWARE: Patentin version 3.0

SEQ ID NOS: 102
